# EMPLOYEE PAYROLL DATA CLEANING AND FINANCIAL ANALYSIS

## PROBLEM STATEMENT

Organizations rely heavily on payroll systems to manage employee salaries, bonuses, and tax deductions. However, payroll data is often affected by inconsistencies such as missing values, duplicate records, incorrect data formats, and calculation errors. These issues can lead to inaccurate salary processing, financial mismanagement, and poor decision-making.

In many organizations, payroll datasets are large and complex, making manual verification difficult and time-consuming. Errors such as incorrect tax deductions or duplicate employee records may go unnoticed, leading to financial discrepancies.

Additionally, while Artificial Intelligence tools are becoming widely available, many users lack the skills to utilize them effectively for data analysis and reporting. This creates a gap between data availability and actionable insights.

This project aims to address these challenges by performing data cleaning and financial analysis on an employee payroll dataset. By applying Excel-based techniques and AI-assisted insights, the project demonstrates how structured data processing can improve accuracy, efficiency, and decision-making in payroll management.

## OBJECTIVES

- To collect and explore a payroll dataset containing employee salary details.
- To identify and correct errors such as missing values, duplicates, and incorrect data formats.
- To perform financial analysis on employee salaries using Excel formulas and pivot tables.
- To create visual representations such as charts and dashboards for better understanding.
- To use an AI chatbot to generate insights and summaries from the dataset.
- To improve data accuracy and demonstrate efficient payroll data handling techniques.

## METHODOLOGY / IMPLEMENTATION PLAN

| # | Phase                                    | Description                                                                                                                                                                                                                                                                                                            |
|---|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>Data Collection &amp; Exploration</b> | Obtain the raw dataset (CSV / Excel) from Kaggle, Edunet, or any suitable source. Understand field names, data types, and row count. For AI prompt projects, define the use case and target audience instead.                                                                                                          |
| 2 | <b>Data Cleaning &amp; Preprocessing</b> | Remove duplicates, handle null or missing values, fix incorrect data types, and standardize data and text formats using Excel (Remove Duplicates, IF, IFERROR, Text-to-Columns) or Power Query. For prompt-based projects, draft and structure initial prompts using Role, Context, Task, Format, and Tone components. |
| 3 | <b>Analysis &amp; AI Integration</b>     | Apply pivot tables, Excel formulas (SUMIF, COUNTIF, VLOOKUP), or Power BI DAX measures to derive key insights. Where applicable, use Microsoft Copilot or an AI Chatbot to generate narratives, summaries, or content outputs from the data or prompts.                                                                |
| 4 | <b>Visualization / Output</b>            | Build interactive dashboards with charts, KPI cards, and slicers in Power BI or Excel. For AI-assisted projects, compile generated content outputs such as reports, marketing copy, or summaries. Document all AI prompts used alongside their outputs.                                                                |
| 5 | <b>Documentation &amp; Submission</b>    | Write the project report, upload all files to a GitHub repository, and record a video demonstration. Submit the GitHub link, video link, and dashboard link (if applicable) for evaluation.                                                                                                                            |

- This project follows a systematic approach to clean and analyze employee payroll data using Microsoft Excel. Initially, a raw dataset containing errors such as missing values, duplicate records, and incorrect data formats was examined. Data cleaning techniques were applied to identify and correct these issues, including handling missing values, removing duplicates, and standardizing data types.
- After cleaning, formulas were used to calculate salary components, and pivot tables were created for analysis. Visualizations such as charts were used to represent the data clearly. Each step of the process was supported with screenshots to demonstrate the transformation from raw data to a structured and accurate dataset.

## Phase 1: Data Collection & Exploration

- A payroll dataset was created to simulate real-world employee salary records. The dataset includes fields such as Employee ID, Name, Department, Basic Salary, Bonus, Tax, Net Salary, and Payment Date.
- Initial exploration revealed several inconsistencies such as missing values, incorrect data entries, and duplicate records.

|    | A           | B             | C          | D                   | E               | F            | G          | H     | I             | J          | K            |

Figure 1: Data Collection (Uncleaned)

## Phase 2: Data Cleaning & Preprocessing

The dataset was cleaned using various Excel tools and techniques to ensure accuracy and consistency.

### 1. Identifying Errors

Errors such as missing salary values, duplicate records, invalid text entries, and incorrect date formats were identified.

### 2. Removing Duplicates

Duplicate employee records were removed using Excel's "Remove Duplicates" feature.

### 3. Handling Missing Values

Missing salary values were filled using appropriate estimation methods.

### 4. Correcting Data Types

Text values in numeric columns were converted into a proper numeric format.

### 5. Fixing Invalid Values

Negative and unrealistic values such as incorrect tax entries were corrected.

### 6. Fixing Date Format

Incorrect and inconsistent dates were corrected.

### 7. Final Clean Dataset

After all corrections, the dataset became structured and ready for analysis.

|    | A           | B             | C          | D                   | E               | F            | G          | H        | I             | J          | K            |

Figure 2: Cleaned Dataset Version

### Phase 3: Analysis & Ai Integration

After cleaning, financial analysis was performed to extract meaningful insights. Excel functions such as SUM, AVERAGE, and IF were used to calculate salary-related metrics. Pivot tables were created to analyze department-wise salary distribution. for assisting with these tasks Ai integration helps. Example ; ChatGPT.

Figure 3: Ai Integration (ChatGPT)

### Phase 4: Visualization / Output

Charts and graphs were created to visually represent payroll insights.

Figure 4: Bar Chart

Figure 5: Pie Chart

Figure 6: Dashboard

## Phase 5: Documentation & Submission

- All steps of the project were documented, and outputs were prepared for submission including dataset, analysis, and report.
- The cleaned dataset and analysis results were verified to ensure accuracy and consistency before submission.

## RESOURCES AND TIMELINE

### A. Hardware & Software Requirements

- Laptop with minimum 4 GB RAM
- Microsoft Excel (2019 or later)
- AI Chatbot (ChatGPT)
- Internet connection
- Web browser

### B. Dataset

- The dataset used in this project is a simulated payroll dataset created to represent real-world employee salary records. It includes details such as employee information, salary components, tax deductions, and payment dates.
- The dataset was intentionally designed with errors such as missing values, duplicates, and incorrect formats to demonstrate the data cleaning process.

### C. Project Timeline

| Phase | Task                                                                      | Tentative Completion Date |
|-------|---------------------------------------------------------------------------|---------------------------|
| 1     | Dataset collection, exploration, and understanding                        | <i>Week 1</i>             |
| 2     | Data cleaning, preprocessing, and validation / Prompt design              | <i>Week 2</i>             |
| 3     | Analysis, AI tool integration (Copilot / Chatbot), and insight generation | <i>Week 2 – 3</i>         |
| 4     | Dashboard / output build, testing, and review                             | <i>Week 3</i>             |
| 5     | Report writing, GitHub upload, and video recording and submission         | <i>Week 4</i>             |

## EXPECTED OUTCOMES / CONCLUSION

The project is expected to result in a clean and structured payroll dataset with all inconsistencies removed. Financial analysis will provide insights into salary distribution, department-wise expenses, and employee compensation patterns.

The use of AI tools will enhance the ability to generate insights and summaries efficiently. The final output will include a well-documented report, visual charts, and a clear demonstration of data cleaning and analysis techniques.

This project highlights the importance of data accuracy and the role of data analytics in improving organizational decision-making.
